

Physical theory of the Sophisticated lines..... 2

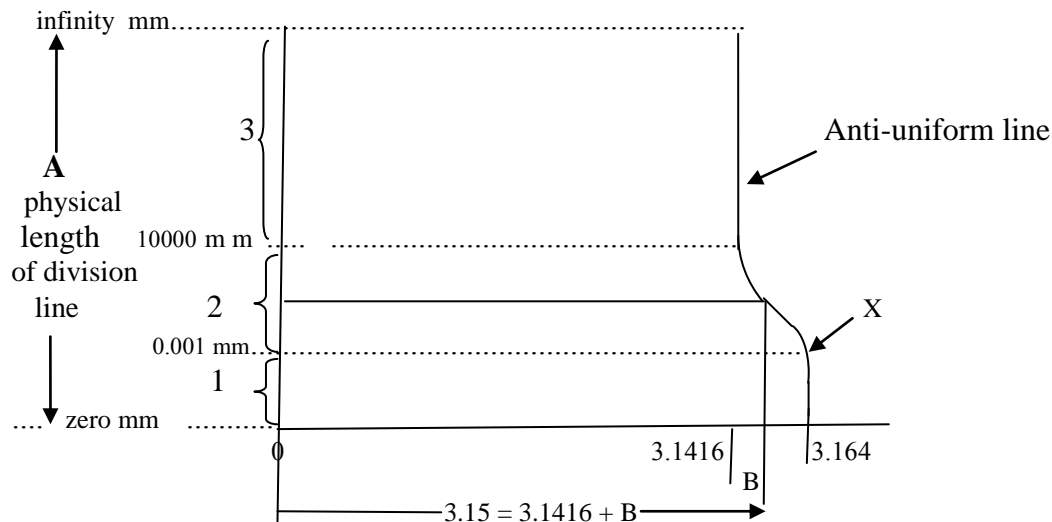

The first Hypothesis graphic illustration

Each point of anti-uniform line, links each A to his internal number.

Internal numbers in the field 3 varying between 3.1416 to "a bit more"

internal numbers in the field 1 varying between 3.164 to "a bit less "

Most of the changes taking place in field 2 almost between 3.1416 to 3.164 (=0.0224)

In field 2 exists A , that its internal number 3.15

$3.15 = 3.1416 + B$

B is part of $0.0224 = 0.0084$

Each point of anti-uniform line, links each A to his B.

There are countless combinations of A and B

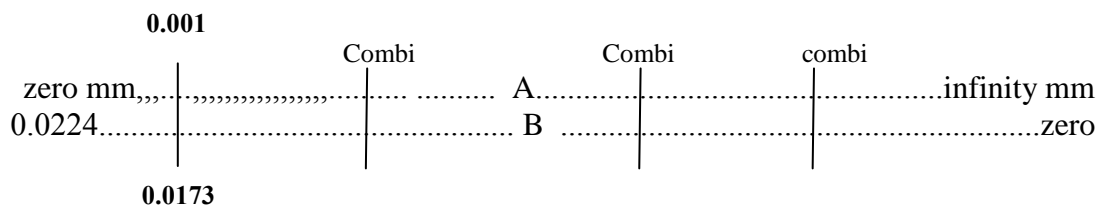

The second hypothesis

Hypothesis of anti-uniform line formula (inspired by kepler) from point X up to infinity

$$ABB = C$$

C is the fixed number of sophisticated lines. to achieve C it is necessary to introduce a hypothesis combination A and B ,(Which is to be tested with practical experiment)

The third hypothesis: (A = 0.001 B = 0.0173)

According to the hypothesis ($ABB = C$ and $A=0.001$ $B = 0.0173$) will achieve the fixed number of sophisticated lines

$$C = ABB = 0.001 * 0.0173 * 0.0173 = 0.0000003$$
